

I fully support this petition. I believe that restricting wideband modes to 1843-2000 Mhz will enable a more efficient and effective use of the entire band. Because of its narrow bandwidth CW is significantly more effective in establishing communication under difficult conditions. Implementing the recommendations in this petition will ensure that amateurs can experiment with low power stations without interference from wider bandwidth modes. Since access to this band is now almost universally available in the amateur community, increasing usage and congestion can easily be predicted especially over the next several years as the sunspots decline. I urge you to take positive action on this petition now to ensure band usage that will be acceptable to all its occupants.
